

Performance Fact Sheet

Imaging Plate Cleaner

The powerful combination of polymer rollers and adhesive pads combine to create the worlds most efficient hand operated contact cleaning system. Use them and experience immediate yield improvements in your manufacturing process.

The polymer rollers have been engineered to remove dry unattached particles from an imaging plate of any size or shape. Small particles down to 2 microns are gently removed by the roller and then transferred to the special adhesive pad. The adhesive on the pad has been carefully designed to ensure no cross contamination to the work piece.

FEATURES	BENEFITS
Different "power levels" of cleaning	A roller and pad to suit every application
Light weight ergonomic design	Easy to use for long periods
Dust is trapped in the adhesive pad	It can be analysed to find the root cause or source
Roller and adhesive are both highly engineered compatible products.	No cross contamination to the substrate being cleaned
Simple snap fit roller construction	Cleaning of the handle is simple - easy replacement of roller
"Wet out" of the polymer roller on the substrate	Ensures intimate contact, gently removing the contamination
Thick, even coat of adhesive on the pad	Holds large particles and lasts longer
